Part 1 - Step 2

What is the IP address of the computer?
IP Address: 192.168.0.101

What is the subnet mask of the computer?
Subnet Mask: 255.255.255.0

What is the default gateway of the computer?
Default Gateway: 192.168.0.1

Part 1 - Step 3

Is the IP address for Admin within this range? Is it expected? Explain your answer.

Answer:

Yes. The assigned IP address falls within the DHCP address pool configured on the wireless router. This is the expected result because the router automatically allocates an available IP address to devices that request network access through DHCP.

Part 4 - Step 2 (f)

Why? (Web Browser will display a Request Timeout after a short time)

Answer:

The browser shows a Request Timeout because the computer is still using an IP address from the previous subnet. Since the router's LAN network has been changed to **192.168.50.0/24**, the computer must obtain a new IP address before it can communicate with the router again.

Part 4 - Step 2 (i)

What is the new IP address information for Admin?

- **IP Address:** 192.168.50.101
- **Subnet Mask:** 255.255.255.0
- **Default Gateway:** 192.168.50.1
- **DNS Server:** 209.165.201.1

Part 4 - Step 2 (l)

Why? (Laptop1 connected to the AP instead of WR)

Answer:

Laptop1 connects to the Access Point because it detects a stronger and more reliable wireless signal from the AP than from the wireless router. Wireless devices normally choose the access point that provides the best signal quality for a more stable connection.
